Danske navne på alverdens fugle. Dansk Ornitoligisk Forening

Forord

Elleve års samarbejde mellem DOF, Landsorganisationen Danske Fugleforeninger, Sammenslutningen af Zoologiske Haver i Danmark og Zoologisk Museum i København er afsluttet med en komplet liste over alverdens fuglenavne på dansk. Det er en kraftpræstation, som der er al mulig grund til at ønske Navnegruppen til lykke med.

Hvad hedder den australske Silver Gull på dansk? I hvert fald ikke Sølvmåge, for det er en helt anden art. Alligevel er det ofte sket, at en oversætter af teksterne til en naturfilm, en bog eller en artikel netop har begået denne og lignende bommerter. Det behøver han eller hun ikke mere. Nu kan oversættere såvel som alle andre med interesse i alverdens fugle gå ind på DOFs hjemmeside www.dof.dk/fuglenavne eller LDF's hjemmeside www.ldf-net.dk samt www.zoo.dk og finde en hvilken som helst fuglear i hele verden og ud fra dens latinske eller engelske navn se, hvad den hedder på dansk. Listen findes også som en bog med smukke illustrationer af kunstneren og ornitologen Jon Fjeldså, der har været med i den gruppe, der har udført det kæmpemæssige arbejde.

Efter mange års tilløb lykkedes det ornitologen Lasse Kreutzfeld i 1996 at samle en gruppe under Dansk Ornitologisk Forening, som involverede repræsentanter for de mest relevante foreninger og institutioner med det formål at give alverdens fugle „moderne, meningsfulde og udtalevendige danske navne.“ Siden da har gruppen møjsommeligt arbejdet sig igennem 11.509 af verdens fuglearter og underarter.

Det har været et kolossalt arbejde, som ikke er forløbet uden sværdsdag og dybe konflikter. De største problemer har været omkring en række arter, der forekommer sjældent i Danmark, og som derfor gennem tiderne ofte har fået forskellige navne fra fuglebog til fuglebog. Hidtil har det i praksis været sådan, at hver ny fuglebogsforfatter eller oversætter enerådigt har „bestemt“, hvad denne eller hin art skulle hedde. Disse arter har Navnegruppen været kritisk igennem og valgt navne til, ud fra en lang række kriterier som er beskrevet i introduktionen til denne liste.

DOFs Hovedbestyrelse har udtrykt stor påskønnelse af Navnegruppens arbejde, og *anbefaler, at Navnegruppens valg af danske fuglenavne bruges fremover*. Ingen har jo autoritet til at bestemme, hvad fuglene skal hedde, så det bliver i praksis ude blandt de danske fugleinteresserede, at navnene skal stå sin prøve. Og her viser al erfaring, at sproget er levende og ændrer sig løbende. Hvem ved fx i dag, hvad en Stokand er? Og alene i min tid har Fjeldvågen haft tre forskellige navne.

Danmark er ikke det eneste land, hvor navngivningen har været årsag til konflikter. På engelsk har den samme fuglear ofte forskellige navne i England og Nordamerika, for slet ikke at tale om afrikanske fuglearter, der ofte har forskellige engelske navne fx i Kenya og Sydafrika. Her har en tilsvarende navnegruppe været alle engelske fuglenavne igennem, som man nu *anbefaler* til brug overalt, og det er disse navne, der udgør de engelske fuglenavne i den danske navneliste.

Selv lykkedes det mig helt problemfrit at omdøbe Kortnæbbet Lomvie til Polarlomvie, da vi begyndte at arbejde med problemerne omkring de grønlandske fuglekolonier, og jeg så også meget gerne resten af „museumsnavnene“ afskaffet. Nu, hvor vi ser mere på fugleude i naturen end i skindsamlinger, ville det være rare, hvis vi fik omdøbt Korttået Træløber til Parktræløber og Kortnæbbet Gås til – ja til hvad? Og hvorfor kalder vi den smukke højarktiske ryle for Islandsk Ryle, når den kun optræder på Island under trækket. Her ville Tundrarilyle være langt bedre. Endelig må det være på tide at omdøbe Grønbenet Rørhøne til blot og bart Rørhøne. Hvorfor skal den stakkels fugl slæbe rundt på et af Danmarks længste fuglenavne, når der ikke er andre rørhøns i Danmark?

Navnegruppen har hjulpet os et kæmpeskridt fremad, så vi for første gang har et gennemarbejdet grundlag at gå videre fra.

Hans Meltofte

Introduktion

Dansk Ornitologisk Forenings Navnegruppe (NAG) blev stiftet den 20. januar 1996 efter et større forarbejde af nu afdøde Lasse Kreutzfeld samt nuværende medlem af NAG, Jørgen Møller Hansen. Dette vigtige forarbejde bestod bl.a. i at samle et arbejdskatalog af ældre forslag fra bøger og tidsskrifter samt af helt nye forslag. Efter en række mislykkede forsøg med at etablere og/eller fastholde en arbejdsgruppe under Dansk Ornitologisk Forening (DOF) i de forudgående ca. 20 år lå det Lasse meget på sinde én gang for alle, at få stiftet en velfungerende, godt sammensat og seriøst arbejdende navnegruppe, der kunne fuldføre døt, der så mange gange tidligere var faldet til jorden. Efter et utrætteligt, stædigt og meget prisværdigt forarbejde, der begyndte allerede i 1991, var en ny gruppe med klart mandat endelig i gang i januar 1996. En gruppe bestående af repræsentanter fra fire foreninger/institutioner med en fælles interesse og berøringsflade for fuglenavne og navngivning, nemlig **DOF, Landsorganisationen Danske Fugleforeninger (LDF), Zoologisk Museum i København (ZM)** og de danske **Zoologiske Haver (DAZA)**.

NAG kan betragtes som Danmarks uofficielle organ for vedtagelse af danske fuglenavne, idet gruppen er godkendt af DOF's og LDF's hovedbestyrelser med mandat til at etablere moderne, meningsfulde og udtalevenslige danske navne for alle verdens fuglearter. Navnegruppen består af ni medlemmer, der alle har interesse for navngivning, og som har haft brug for at forholde sig til dette i forskellige sammenhænge. Det gælder i forhold til Danske Fugleforeningers medlemmer, Zoologiske Haver, Zoologisk Museum og i Dansk Ornitologisk Forening. Dertil kommer enkeltpersoner, som har leveret værdifulde kommentarer til gruppens arbejde. Gruppens møder er afholdt i DOF's lokaler, i Københavns Zoologiske Have og hos gruppens medlemmer. Vi takker alle for husly. Alle i gruppen har ydet en stor indsats, men Mogens Behnke-Pedersen skal især fremhæves for at have arbejdet i tusindvis af timer på at samle gruppens arbejde og få det til at fremstå som det produkt, det er i dag.

NAG er en del af en trend i at navngive danske dyr. **Projekt Danske Dyrenavne** under Søren Breiting er gået i gang med at navngive de ca. 20.000 insekter, leddy og andre smådyr, der forekommer i Danmark. Ifølge Søren Breiting er der mange gode grunde til at vælge danske navne på unavngivne dyregrupper, ikke mindst af pædagogiske årsager. Vi kan ikke undvære navne på så mange ting som muligt i vores indbyrdes kommunikation.

Selve motivationen til at gå i gang med et så omfattende arbejde skulle nok findes i en større forvirring omkring navngivning af arter uden for den vestpalæarktiske region. Dette har i mange tilfælde været særlig tydeligt i naturudsendelser i fjernsynet, når lange engelske fuglenavne skulle fordanske. Eller at se en TV-udsendelse med stormfugle og her se en mollymawk (en gruppe af små albatrosser fra de sydlige verdenshav) blive oversat med Mallemuk (vor egen lokale stormfugl) har været en god grund til at tage affære. Derudover har det været et problem, når foreninger/institutioner med fælles interesse og berøringsflade for fuglenavne anvendte forskellige navne.

GRUPPENS MEDLEMMER

Gruppens medlemmer har siden stiftelsen i 1996 været **Lars Nørgaard Andersen, Jon Fjeldså, Ole Geertz-Hansen, Ivan Olsen, Svend Rønnest, Mogens Behnke-Pedersen** (fra lidt inde i forløbet), alle repræsentanter for **Dansk Ornitologisk Forening**, og **Jon Fjeldså** tillige repræsentant for **Zoologisk Museum**.

Jørgen Møller Hansen, Flemming Nielsen og **Henning Pust** er repræsentanter for **Landsorganisationen Danske Fugleforeninger**, samtidig med at Flemming Nielsen også er repræsentant for de danske **Zoologiske Haver**. I det første år af Navnegruppens virke var **Lasse Kreutzfeld** (indtil sin død) medlem af arbejdsgruppen og i en årrække også **Lars Gissing Hansen**, begge repræsentanter for DOF. Som ekstern konsulent virkede **Finn Frandsen** i de første år.

Gruppens medlemmer har samlet set rejst i alle verdensdele og tilsammen set omkring halvdelen af verdens fuglearter! Dette har givet et godt grundlag for et seriøst arbejde. Samtidig har alle i gruppen tilgang til enten eget omfattende bibliotek eller DOF's endnu mere omfattende bibliotek, således at god tekstbeskrivelse samt billedmateriale har dannet grundlag for navnevædtagelserne.

NAVNGIVNINGENS UDGANGSPUNKT

I arbejdet med taksonomien har Navnegruppen fra starten anvendt Monroe og Sibleys „**A World Checklist of Birds**“ (1993) som grundlag og udgangspunkt for navngivningsarbejdet. Denne checkliste er baseret på samme forfatteres „**Distribution and Taxonomy of Birds of the World**“ (1990) samt et „**Supplement**“ til dette (1993). Disse værker er meget roste, men der har også været skarp kritik af en række aspekter i deres arbejde. Uanset sidstnævnte kritik var der dog bred enighed om, at denne checkliste kunne regnes for den hidtil bedste ved NAG's etableringstidspunkt i januar 1996. NAG's ekspert på det taksonomiske område - Jon Fjeldså - argumenterede fra starten ret præcis for perspektiverne og det hensigtsmæssige i at bruge netop denne checkliste til NAG's arbejde. Monroe og Sibleys checkliste indeholder 9.702 arter, hvoraf de 68 regnes for uddøde. Hertil kommer et stort antal „underarter/del-arter“ (component species), dvs. potentielle arter, som for nuværende har formel status som underarter under bredt accepterede arter.

Siden Monroe & Sibleys checkliste fra 1993 har verden set en håndfuld nye lister over verdens fugle, bl.a. „World Bird Species Checklist - with alternative English and scientific names“ (M.G. Wells 1998) og „Birds of the World – A Checklist“ (James F. Clements 2000). Desuden har det store, til skyerne roste værk, „**Handbook of the Birds of the World**“ (J. del Hoyo, A. Elliott & J. Sargatal) været i gang siden 1992 med tolv færdige bind ved årsskiftet 2007/2008.

Disse lister og værker er i kraft af deres udgivelsestidspunkter i stand til at fremvise alle nybeskrevne arter siden Monroe og Sibley, samt ikke mindst samle op og gøre status i forhold til mange af de potentielle arter, der listes i Monroe og Sibley som „del-arter“. Mange af disse er allerede bredt accepterede gode arter, men der er også i de nye værker bredt accepterede arter med, som end ikke optræder som „del-arter“ i Monroe og Sibley – hovedsagligt „nye arter“, hvor DNA-materiale har spillet en væsentlig rolle for deres status.

NAG har valgt at følge Monroe og Sibleys checkliste til vejs ende, men har allerede som en naturlig ting inddraget de nybeskrevne arter i vores navneliste/navngivning. Desuden har vi medtaget bredt accepterede arter, som enten ikke er nævnt eller står som „del-art“ i Monroe og Sibley. Verdenslisten, der følger systematikken i Monroe og Sibleys liste, er siden blevet fulgt op af et længerevarende arbejde af en gruppe under Frank Gill og Minturn Wright (**Birds of the World – Recommended English Names**) som NAG også har arbejdet ud fra.

PRINCIPPER FOR NAVNGIVNING

Gruppens udgangspunkt i navngivningsarbejdet er baseret på to forskellige grundprincipper:

Vore egne Principper for navngivning:

1. Navnene bør være håndterlige, altså så korte som muligt, lette at udtale og sprogligt gode, uden for mange led.
2. Navnene bør være i overensstemmelse med moderne taksonomi, hvilket f.eks. betyder, at fluesnapperne skal opdeles i amerikanske fluesnappere (Tyrannidae = tyraner), afroasiatiske fluesnappere (Monarchidae = monarkfluesnappere) og eurasiske fluesnappere (Muscicapidae = fluesnappere). Der skal samtidig tilstræbes en vis systematisk logik i navngivningen.
3. Navnet bør være selvforklarende og indlysende. Det skal så vidt muligt referere til artens udbredelse (især for arter der er endemiske for et mindre område som f.eks. øer), dragtkarakterer eller andre karakteristika ved fuglen, tilholdssted eller habitatvalg, dens lyd eller specielle adfærdstræk. Navnet skal også være logisk set i forhold til artens samlede udbredelsesområde. Det bør altså være karakteriserende for fuglene. Der kan her forekomme geografiske navne, som i almindelighed vil være ukendt på dansk, f.eks. Punaibis (Puna er græslandet i Andesbjergene i f.eks. Bolivia og Peru). Geografiske navne kan forandres efter skiftende regeringer (Formosa til Taiwan, Celebes til Sulawesi eller Abessinien til Etiopien), men det bør ikke få indflydelse på et allerede givet navn. Sammensætningen af et mindre kendt geografisk stednavn og et mindre kendt familienavn kan skabe problemer med genkendelse og udtale. I de tilfælde er navnet delt af en bindestreg.
4. De bør ikke indeholde personnavne. Nogle navne er dog allerede så indarbejdede, at det i praksis ikke er muligt – og vel egentlig også anstødeligt – at ændre dem som f.eks. Stellersand, Bonapartesmåge og Temmincksryle.
5. Der vil være direkte overtagelse af fremmedsprogede navne, som allerede er indarbejdede i det ornitologiske sprog, som f.eks. Trogon, Mannakin og Bulbul.
6. Navnene bør ikke være direkte misvisende ved f.eks. at kalde visse amerikanske „redstarts“ (skovsangere) uden rødt i halen for rødstjerter, eller f.eks. at anvende betegnelsen „almindelig“.
7. Hvor det er muligt og givtigt bør navnene findes blandt allerede eksisterende forslag (hævdprincipippet).
8. Navnelisten skal ikke nødvendigvis tages til indtægt for en taksonomisk opfattelse.
9. Navnene skal ske på grundlag af officiel dansk retstavning (med to undtagelser: Stillits og Ederfugl, som er hævdvundne stavemåder). Bindestreg anvendes for at lette læsevenigheden. Der, hvor der optræder usædvanlige ord i både for- og efternavn, indsættes bindestreg.

Finn Frandsen har udarbejdet **10 „Tommelfinger-regler“**. Af disse har udvalget arbejdet efter følgende syv (let omskrevne):

- 1a. Et artsnavn bør højst bestå af to led.
- 1b. Uanset om et artsnavn er enkeltleddet (solitært) eller to-leddet, bør det højst rumme fire rodord (**Hals-bånd-s-trold-and; Rød-top-pet Fugl-e-konge**).
2. En fælles basis for navngivningen af en hel slægt eller dele deraf bør være karakteristisk for de fleste - meget gerne alle - af de pågældende arter.
3. Basen bør ikke bestemmes af en overfladisk lighed med ikke-beslægtede arter (f.eks. Stor Ørkendompap og Kapdue).
4. Et solitært navn bør foretrækkes frem for et to-leddet, hvis sammenkoblingen med basen kan ske uden at gøre vold på sproget (Grønspætte frem for Grøn Spætte; Blå Kærhøg frem for Blåkærhøg).
- 5a. Det ord, der kobles til basen, bør være umiddelbart forståeligt og ikke kræve specialviden.
- 5b. Det må helst ikke give fuglens navn en fonetisk lighed med en anden arts navn (Gråmejse/Blåmejse; Bøgesanger/Høgesanger)
- 5c. Kombinationen bør ikke være fonetisk uheldig.
- 5d. Kombinationen bør ikke være semantisk uheldig (Ørkenagerhøne)

-
6. Hvis et geografisk navn skal indgå i et artsnavn, må det være karakteristisk for netop den pågældende art. Det skal passe ind i dansk udtaletradition og bør så vidt muligt kunne indgå som en del af et solitært navn!
 7. Et artsnavn bør være betegnende for alle artens eventuelle underarter.

Selv med så mange elementer inde over navngivning (eller måske netop derfor), har vi flere gange måttet lave undtagelser fra vores principper. Bør venligst over med det! Fritz Palmquist har meget venligt gjort opmærksom på fejl og mangler i vores principper. Vi har så vidt muligt rettet ind efter hans råd. Ligeledes har Søren Breiting udformet nogle principper for navngivning af dyr i Danmark. Vi har også skelet til disse og implementeret dem i vores.

GRUPPENS FREMTID

Navnegruppen håber selvagt, at de foreslæde navne vil blive brugt. Foreninger og institutioner bag gruppen anbefaler enstemmigt, at de navne, som anføres i listen, følges. At der er kommet en anbefalet liste over alverdens fuglenavne betyder ikke nødvendigvis, at det danske sprog skal forarmes. Navne som Brunnakke (Pibeand), Perleand (Spidsand), dyttelytter (små vadefugle), Pryllemænd (Almindelig Ryle), Skovduer (Ringdue) og Grossenolliker (Gråspurve) vil forhåbentlig ikke forsvinde ud af det danske sprog. Disse er tegn på en opfattelse af en fugl eller en fuglegruppe og på en udvikling, som ikke holder op med denne liste. Der vil også i fremtiden være behov for en navnegruppe til at justere ændringer, enten taksonomiske i henhold til nye arter, eller i henhold til en sproglig udvikling. Mindst fem forskellige forhold kan gøre sig gældende i et fremtidigt arbejde i en navnegruppe:

1. Der er f.eks. et værre rod i gruppen af småfinker: De hedder på tværs af de forskellige familier sisken eller irisk. Rørspurv, Gulspurv og Snespurv forekommer blandt en mængde værlinger.
2. Svaleklire hedder sådan, fordi den i flugten har mindelser om en Bysvale. Den amerikanske pendant til vor Svaleklire har ikke den hvide overgump. Skal sådanne uoverensstemmelser tilpasses?
3. Stellersand er navngivet efter Georg Wilhelm Stöhler, hvis navn blev angleriseret til Steller. Hvis tyskerne på et tidspunkt gør krav på Stöhlers tilhørsforhold, skal den så hedde Stöhlersand? Da Kuhls Skræpe fra Atlanten er beskrevet af Cory, hedder den Cory's Shearwater på engelsk, men er på dansk opkaldt efter en af Temmincks assistenter! Endnu er der ikke helt styr på, hvilken af de tre former af Kuhls Skræpe, der er set i Danmark. Når der er styr på det, hvad skal de så hedde? Og skal et personnavn reflektere en person, der har gjort meget for et områdes fugleliv (A. Wilson eller J.J. Audubon i Amerika), en eller anden nær ven eller familiemedlem af en sådan (E. Sabine), eller en person, som ikke har gjort noget specielt for ornitologien (L. Schwarz)? Og kan en fugl bære en sur og vrangvillig persons navn og bære dennes karakteristika videre (J.R. Forster)?
4. Det engelske sprog indeholder navne på langt flere farver end det (gængse) danske. Mange fugle med brunlige nuancer kan hedde noget med rød eller brun. Vor opfattelse af en farve kan vise sig ikke at holde, så der vil være behov for at omdøbe en art.
5. Geografiske stednavne er et bestandigt problem: Burma skifter navn til Myanmar, Ceylon til Sri Lanka, Formosa til Taiwan, og det stopper ikke her.

I takt med, at beskrivelser af fugle inddrager flere og flere dele af fuglene, vil der også på et tidspunkt være behov for en standardiseret navngivning af fuglenes topografi på dansk. Navnegruppen har efter bedste evner sat sig for at give de bedste navne. I nogle tilfælde er de bedste evne ikke godt nok, og navnet kan af mere eller mindre indlysende grunde være uheldigt eller forkert. I så fald vil gruppen meget gerne høre om det og vil efterfølgende tage stilling til navngivningen. Da listen herunder samtidig publiceres elektronisk, har vi mulighed for at komme med hurtige rettelser. Vi er derfor interesserede i henvendelser i tilfælde af sådanne uheldige navne. Kommentér venligst på Navnegruppens e-mail adresse (navnegruppen@dof.dk).

FORMALIA

Bogen igennem er listen bygget op på samme måde:

<i>Melanitta fusca</i>	Velvet Scoter	Fløjlsand
<i>Melanitta (f.) stejnegeri*</i>	Asiatic Scoter	Asiatisk Fløjlsand

Til venstre i *kursiv* ses det videnskabelige navn efter seneste indhentede oplysninger om artens taksonomi. Navne markeret med * er enten del-arter som (måske) står for at blive opnøjet til arter, eller del-arter som allerede har danske navne, på trods af at de (måske) altid vedbliver at være del-arter. I midten med normal skrift ses artens engelske navn efter de anbefalede navne i Frank Gill og Minturn Wright: Birds of the World, Recommended English Names med enkelte nye tilføjelser fra Internettet. Til højre ses med **fed** det anbefalede danske navn.

<i>Cygnus columbianus</i>	Whistling Swan	Pibesvane
<i>Cygnus (c.) columbianus*</i>	Tundra Swan	Tundrasvane
<i>Cygnus (c.) bewickii*</i>	Bewick's Swan	Pibesvane

I tilfælde hvor samme navn optræder to steder, vises artens navn (nominatnavnets to led) øverst og del-arternes navne (tre led) nedenunder. Det er tilstræbt, at nominatens danske navn (her Pibesvane for *Cygnus columbianus*) er det samme som nominatens tre-leddede navn (her *Cygnus columbianus columbianus*). Som tilfældet her, har det ikke altid været muligt.

*Mergus australis** † Auckland Island Merganser **Aucklandskallesluger**

Arter der er, eller formodes at være uddøde, vil i bogen være markeret med † eller †?

Ved flere slægter eller familier knyttes øverst nogle få kommentarer til den seneste taksonomiske udvikling.

HJEMMESIDE & BOG

Navnegruppens formål er ikke alene at navngive alverdens fuglearter, men selvfølgelig også at delagtiggøre interesserede brugere i gruppens arbejde og navnevalg. Vi har derfor valgt at lægge gruppens arbejde på DOF's og LDF's hjemmesider som separate Adobe Acrobat PDF-filer. Disse filer kan frit hentes, læses eller kommenteres på Navnegruppens e-mail adresse af enhver, der har en computer med net-opkobling.

TAK

En lang række enkeltpersoner har gennem årene reflekteret på vores navne og bidraget med kommentarer til vor navngivning. Alle bedes modtage vores varmeste tak. I den forbindelse vil vi rette en tak til personer der i særlig grad har bidraget med konstruktive kommentarer og navneforslag og derigennem haft indflydelse på bogens endelige resultat. Denne særlige tak skal rettes til Eddie Bach, Rasmus Bøgh, Simon Bruslund, Knud Flensted, Lars Holst Hansen, Niels Krabbe, Flemming Lundgren, Hans Meltofte, Frank Sundgaard Nielsen, Fritz Palmquist, Peter Rindom, Christian Svane, Helge Sørensen, Preben Riis Sørensen og Lars Thomas.

Ændrede slægtsnavne

Vor navneliste er oprindelig baseret på Burt L. Monroe, Jr. og Charles G. Sibley's „A World Checklist of Birds“ fra 1993. Mod slutningen af vort arbejde med at give danske navne til alverdens fugle, udkom der på vegne af IOC i 2006 et nyt revideret værk: „Birds of the World“ med foreslæde engelske navne, af Frank Gill og Minturn Wright. Dette projekt, en standardisering af engelske navne blev iværksat af IOC, som udpegede Burt L. Monroe som formand, med mandat til at udvælge elleve velkendte ornitologer som medlemmer til en navnecommitte. Efter Burt L. Monroe's død overtog Frank Gill posten som formand for kommitteen der endte op med 28 medlemmer.

Omkring årsskiftet 2006-2007 valgte navnegruppen, med tilladelse fra Frank Gill, at følge den ny systematik, og de ændrede navne i „Birds of the World“. Resultatet blev en ændring af mange af de slægtsnavne vi havde anvendt fra Sibley og Monroe's „A World Checklist of Birds“.

De ældre slægtsnavne til venstre er listet i alfabetisk orden, og de nye til højre:

Fuglenes systematik er i disse år under kraftig revision. Det skyldes for det første, at grundigere studier, bl.a. af fuglenes stemmer, fører til at mange tidligere underarter nu accepteres som gyldige arter. For det andet arbejdes der meget intensivt med DNA-baserede analyser af slægtskabsforhold mellem og indenfor de enkelte fuglegrupper. Hvis vi skal kunne nå frem til meningsfulde fortolkninger af ligheder og forskelle mellem arter og grupper er det vigtigt, at fuglene er ordnet på en måde som genspejler dette slægtskab. Derfor udmøntes ny viden om fuglenes evolution i hyppige ændringer af klassifikationen. Vi har i denne database ikke villet bryde den opdeling i familier, og den rækkefølge, som er foreslægt af Gill & Wright i „Birds of the World“. Hvor der foreligger overbevisende ny forskning som viser at klassifikationen bør ændres har vi i stedet tilføjet en kommentar (tit med henvisning til en vigtig ny publikation). Disse kommentarer kan måske forvirre, men vi håber også at de kan tjene som en nyttig vejledning om hvilke ændringer som må forventes at slå igennem i de kommende år.

Fugle som endnu ikke har kunnet henføres til en bestemt familie placeres under overskriften *Incertae Sedis* (latin for uklar/usikker placering i systematikken).

TINAMIFORMES - *Tinamidae*

TINAMOUS

TINAMUER

TINAMIFORMES - Denne gruppe udgør, sammen med Struthioniformes (strudse), Rheiformes (nanduer), Casuariiformes (kasuarer) og Dinornithiformes (moafugle og kivier), den ældste gruppe af nulevende fugle, Palaeognathae (dvs. dem med „gammelt“, altså dinosaur lignende mundloft). Gruppen blev antagelig udspaltet tidligt i kridttiden, for mere end 100 millioner år siden.

GALLIFORMES - Megapodiidae

MEGAPODES

GALLIFORMES - Hønsefugle udgør, sammen med andefugle, den ældste udviklingsgren næst efter de strudsrigtende fugle på fuglenes stamtræ. Antagelig blev de udspaltet for næsten 100 millioner år siden i kridttiden. Basert på DNA-data er en ny klassifikation foreslægtet i Cladistics 22 (2006): 495-532 (se under Cracidae, Odontophoridae og Phasianidae).

ANSERIFORMES - *Anatidae***DUCKS, GEESE, SWANS****ANDEFUGLE**

Anatidae - Nye DNA-data giver grundlag for visse ændringer, bl.a. at *Malacorhynchus/Biziura* og *Oxyura/Nomonyx* repræsenterer meget tidlige udviklingslinjer og bør derfor placeres umiddelbart efter *Dendrocygna*. Endvidere bør dampskibsænderne (*Tachyeres*) placeres umiddelbart foran svømmeænderne (*Lophonetta, Speculanas, Anas*).

PODICIPEDIFORMES - Lappedykernes slægtskabsforhold og placering i systemet byder stadigvæk på problemer. Anatomiens tyder på slægtskab med lommer, men hvis vi ser bort fra bygningstræk som hænger sammen med deres svømmende levevis ligner de mere flamingoer, i overensstemmelse med de nyeste resultater fra DNA-forskningen (Proceedings Royal Society London B 268 (2001): 1-6; Biology Letters doi: 10.1098/rsbl. 2006. 0523).

PELECANIFORMES - Der har været megen diskussion om hvorvidt årefodede fugle udgør en selvstændig udviklingslinje indenfor vandfuglene. De nyeste DNA-data tyder på at Fregatidae (fregatfugle), Sulidae (suler), Phalacrocoracidae (skarver) og Anhingidae (slangehalsfugle) virkelig udgør en selvstændig udviklingslinje men at Pelecanidae (pelikaner) er beslægtet med Scopidae (hammerhovedhejre) og Balaenicipitidae (træskonæb). Phaethontidae (tropikfugle) har intet at gøre med de egentlige vandfugle og mangler nære slægtninger blandt nulevende fugle (Biology Letters doi: 10.1098/rsbl.2006.0523).

FALCONIFORMES - Det er stadigvæk meget uklart hvor rovfuglene bør placeres i fuglenes stamtræ. De har traditionelt været opfattet som primitive medlemmer af vandfuglene, og der har især været fremført argumenter for at vestgribbene skulle være i slægt med storke. De seneste resultater fra DNA-forskningen tyder dog på at falke, høge og vestgribbe repræsenterer tre uafhængige udviklingslinjer indenfor de såkaldte „højere landfugle“ (dvs. grupper placeret efter Columbidae i den henværende liste).

FALCONIFORMES - Accipitridae
KITES, HAWKS, EAGLES
GLENTER, ØRNE & HØGE

Accipitridae - Baseret på nye DNA-data (f.eks. Molecular Phylogenetics and Evolution 27 (2003): 328-342, 35 (2004): 147-164 og 37 (2005): 327-346) bør gruppen (udenom *Sagittarius* og *Pandion*, som i de fleste klassifikationer regnes som selvstændige familier) opdeles i underfamilierne Elaninae, Perninae, Milvinae, Aegypiinae, Gypaetinae, Circaetinae, Polyboroidinae, Aquilinae, Accipitrinae, Cincinae, Haliaeetinae, Buteoninae, Harpiinae og Melieraxinae. Klassifikation af ørne og høgeørne ændres væsentligt (skrigeørne flyttes til slægten *Lophaetus*, afrikanske høgeørne til *Aquila*, *Oraetus* burde indgå i den sydamerikanske *Spizaetus*, og de orientalske høgeørne (nu *Spizaetus*) burde have en ny slægt *Nisaetus*.

GRUIFORMES - Denne orden er en kunstig gruppe, som ikke kan opretholdes (Biology Letters doi: 10.1098/rsbl. 2006. 0523). Ifølge den nyeste DNA-forskning hører Rhynochetidae (kagu), Eurypygidae (solrikse) og Mesitornithidae (drosselrikser) hjemme blandt nogle meget gamle grupper („Metaves“, med bl.a. duer, hoatzin, flamingoer og lappedykkere). Turnicidae (løbehøns) bør overføres til Charadriiformes, og Cariamidae (slangetranner) hører formentlig hjemme nær falkene, blandt de „højere landfugle“. De øvrige familier udgør derimod en naturlig gruppe blandt de egentlige vandfugle, med to udviklingslinjer: familierne Heliornithidae, Sarothuridae og Rallidae,

og familierne Psophiidae, Gruidae og Aramidae.

CHARADRIIFORMES - Dette er en af de meget gamle fuglegrupper, idet dens hovedgrupper formentlig blev udspaltet allerede sent i Kridttiden, for 70-80 millioner år siden. Nye analyser af slægtskabsforholdene er publiceret i Journal of Avian Biology 35 (2004): 191-194 og Biology Letters (doi: 10.1098/rsbl. 2006. 0606). Heraf fremgår bl.a. at Turnicidae (løbehøns) skal med i ordenen, medens Pteroclidae (sandhøns) skal ud, og placeres i Columbiformes. Slægten *Pluvianus* er en uafhængig udviklingslinje som burde have sin egen familie (efter Burhinidae).

CHARADRIIFORMES - Laridae
GULLS, TERNS, SKIMMERS
MÅGER, TERNER & SAKSNÆB

Laridae - Slægterne *Anous* og *Gygis* burde placeres først, idet deres udviklingslinjer kan føres tilbage til før splittet mellem terner og måger (Biology Letters, doi: 10.1098/rsbl. 2006. 0606). Ternene bør omklassificeres (iflg. Molecular Phylogenetics and Evolution 35 (2005): 459-469) som *Onychoprion* (brilleterner) og *Sternula* (dværgterner), derefter de monotypiske slægter *Phaetusa*, *Geochelidon*, *Hydroprogne* og *Larosterna*, og endelig *Chlidonias* (moseterner), *Thalassus* (splitterner) og *Sterna* (øvrige terner).

COLUMBIFORMES - Duerne synes, ifølge den nyeste DNA-forskning (Biology Letters doi: 10.1098/rsbl. 2006. 0523), at høre hjemme blandt de meget gamle udviklingslinjer („Metaves“, med bl.a. Opisthocidae (hoatzin) og Mesitornithidae (drosselrikser)). Indenfor duer synes de små amerikanske jordduer (*Claravis*, *Metriopelia*, *Columbina*, *Scardafella*) at udgøre den ældste udviklingslinje, og de burde derfor flyttes op foran de andre slægter.

PSITTACIFORMES - Ifølge molekylær systematik bør formentlig kakaduerne (*Calyptorhynchus*, *Eolophus*, *Cacatua*, *Nymphicus*) placeres umiddelbart efter *Strigops*. Papegøjerne repræsenterer en gammel fuglegruppe som formentlig er nærmest i slægt med Passeriformes (spurvefugle) og Falconidae (falke).

OPISTHOCOMIFORMES - Hoatzinens systematiske placering har været meget omdiskuteret, men den nyeste DNA-forskning tyder på at den hører hjemme blandt de meget gamle udviklingslinjer („Metaves“), ligesom Mesitornithidae (drosselrikser), Eurypygidae (solrikse) og Rhynochetidae (kagu) (Biology Letters doi: 10.1098/rsbl. 2006. 0523)

STRIGIFORMES - Ifølge den nyeste DNA-forskning repræsenterer uglerne, på linje med Falconidae (falke), Cariamidae (slangetræner), Leptosomidae (kurol), Cathartidae (vestgribbe) og Accipitridae (høge), tidlige udviklingslinjer blandt de „højere landfugle“. Der opdages jævnligt nye uglearter, bl.a. på baggrund af bioakkustiske data.

CAPRIMULGIFORMES - Ifølge den nyeste DNA-forskning udgør disse „natfugle“, sammen med sejlere og kolibrier (Apodiformes), en meget gammel udviklingslinje, hvis præcise placering i fuglenes system dog er uafklaret. Formentlig er udspaltningen af familierne Podargidae, Steatornithidae, Nyctibiidae, Caprimulgidae og Aegothelidae sket på et meget tidligt tidspunkt i udspaltningen af de moderne fuglegrupper.

CORACIFORMES - Skrigefuglene udgør en kompleks gruppe sammen med Piciformes (spættefugle). Indenfor dette kompleks udgør Bucerotidae (næsehornsfugle), Bucorvidae (hornrvanne), Upupidae (hærfugle) og Phoeniculidae (skovhærfugle) en egen udviklingslinje, og Leptosomatidae (kurol) indtager en meget isoleret position (Biology Letters doi: 10.1098/rsbl. 2006. 0523).

CORACIFORMES - *Leptosomatidae*

CUCKOO ROLLER

Leptosomatidae - Ifølge de nyeste DNA-data falder kurolen udenfor de egentlige skrigefugle, idet denne specialiserede kamæleon-jæger, sammen med Falconidae, Cathartidae, Strigidae og Accipitridae, udgør dybe grene indenfor stamtræet for „højere landfugle“.

PICIFORMES - *Picidae*

WOODPECKERS

Picidae - Opdelingen i slægter har været meget svært at udrede, idet der, ifølge de nyeste DNA-data, ser ud til at der for 5.7 millioner år siden var flere uafhængige og næsten samtidige kolonisationer fra Asien til Afrika og Amerika (se Zoologica Scripta 36/2007): 11-25). Der er grundlag for at lave en del om på opdelingen i slægter og rækkefølgen blandt de egentlige spætter (relevant for *Dendrocopos*, *Picoides*, *Picus*, *Celeus* og *Picus*). Derimod er der ingen grund til at ændre på opdelingen af tidlige udviklingslinjer (*Jynx*, *Sasia* og *Picumnus*).

PASSERIFORMES - Spurvefuglene er, modsat hvad man tidligere har troet, en gammel gruppe som formentlig kan føres tilbage til sent i Kridttiden. Gruppen omfatter tre udviklingslinjer: Acanthisittidae (New Zealand), Suboscines (med primitivt stemmeorgan) og Oscines (sangfugle, med kompleks syrinx) (Journal of Avian Biology 34 (2003): 3-15; PNAS 101 (2004): 11040-11045). Suboscinerne omfatter tre store grupper: Eurylaimae (den gamle verdens brednæb og pittaer) og Sydamerikas „tyranner“ (Tyrannidae) og „tracheophone“ grupper (Thamnophilidae t.o.m. Furnariidae). Sangfuglene omfatter nogle gamle australske grupper (Menuridae t.o.m. Cinclosomatidae) som gav ophav til de kragelignende fugle (Platysteiridae t.o.m. Paradisaeidae) og Passeridae, med alle de øvrige mere end 3500 arter af spurvefugle. Den nyeste DNA-forskning lægger op til betydelige ændringer i systematikken indenfor næsten alle disse grupper.

PASSERIFORMES - Philepittidae**ASITIES****ASITIER**

Philepittidae - burde, ifølge den nyeste DNA-forskning, placeres som en underfamilie til hovedgruppen af brednæb (Eurylaimidae).

<i>Philepitta castanea</i>	Velvet Asity	Fløjlsasiti
<i>Philepitta schlegeli</i>	Schlegel's Asity	Gulnakket Asiti
<i>Neodrepanis coruscans</i>	Common Sunbird-Asity	Seglnæbsasiti
<i>Neodrepanis hypoxantha</i> †	Yellow-bellied Sunbird-Asity	Gulbuget Asiti

PASSERIFORMES - Sapayoaidae**SAPAYOA****SAPAYOA**

Sapayoaidae - Tidligere regnet som en manakin (Pipridae), men er ifølge den nyeste DNA-forskning, nærmest i slægt med brednæb (Zoologica Scripta 35 (2006): 567-580 og American Museum Novitates 3544 (2006): 1-22).

<i>Sapayoaaenigma</i>	Broad-billed Sapayoaa	Sapayoaa

PASSERIFORMES - Pittidae**PITTAS****PITTAER**

Pittidae - Ny slægtsopdeling er foreslået i Zoologica Scripta 35 (2006): 567-580.

<i>Pitta phayrei</i>	Eared Pitta	Ørepitta
<i>Pitta nipalensis</i>	Blue-naped Pitta	Blånakket Pitta
<i>Pitta soror</i>	Blue-rumped Pitta	Blågumpet Pitta
<i>Pitta oatesi</i>	Rusty-naped Pitta	Rustpitta
<i>Pitta schneideri</i>	Schneider's Pitta	Blårygget Pitta
<i>Pitta caerulea</i>	Giant Pitta	Kæmpepitta
<i>Pitta cyanea</i>	Blue Pitta	Rødnakket Pitta
<i>Pitta elliotii</i>	Bar-bellied Pitta	Smaragdpitta
<i>Pitta guajana</i>	Banded Pitta	Gyldenbrynet Pitta
<i>Pitta gurneyi</i>	Gurney's Pitta	Gurney's Pitta
<i>Pitta kochi</i>	Whiskered Pitta	Luzonpitta
<i>Pitta erythrogaster</i>	Red-bellied Pitta	Rødbuget Pitta
<i>Pitta dohertyi</i>	Sula Pitta	Sulapitta
<i>Pitta arquata</i>	Blue-banded Pitta	Halsbåndspitta
<i>Pitta granatina</i>	Garnet Pitta	Granatpitta
<i>Pitta venusta</i>	Graceful Pitta	Sumatrapitta
<i>Pitta ussheri</i>	Black-crowned Pitta	Sabahpitta
<i>Pitta baudii</i>	Blue-headed Pitta	Blåkronet Pitta
<i>Pitta sordida</i>	Hooded Pitta	Kappepitta
<i>Pitta (s.) novaeguineae</i> *	Black-headed Pitta	Hættepitta
<i>Pitta maxima</i>	Ivory-breasted Pitta	Halmaherapitta
<i>Pitta steerii</i>	Azure-breasted Pitta	Azurpitta
<i>Pitta superba</i>	Superb Pitta	Manuspitta
<i>Pitta angolensis</i>	African Pitta	Afrikansk Pitta
<i>Pitta reichenowi</i>	Green-breasted Pitta	Grønbrystet Pitta
<i>Pitta brachyura</i>	Indian Pitta	Indisk Pitta
<i>Pitta nympha</i>	Fairy Pitta	Nymfepitta
<i>Pitta moluccensis</i>	Blue-winged Pitta	Blåvinget Pitta
<i>Pitta megarhyncha</i>	Mangrove Pitta	Mangrovepitta

<i>Pitta elegans</i>	Elegant Pitta	Pragtpitta
<i>Pitta vigorsii</i>	Double-striped Pitta	Sundapitta
<i>Pitta iris</i>	Rainbow Pitta	Regnbuepitta
<i>Pitta versicolor</i>	Noisy Pitta	Larmpitta
<i>Pitta amerythra</i>	Black-faced Pitta	Maskepitta

PASSERIFORMES - Pipridae**MANAKINS****MANAKINER**

Pipridae - Bemærk at flere slægter som tidligere indgik i denne familie nu findes i Tyrannidae.

<i>Ilicura militaris</i>	Pin-tailed Manakin	Spidshalet Manakin
<i>Masius chrysopterus</i>	Golden-winged Manakin	Gladiatormanakin
<i>Corapipo gutturalis</i>	White-throated Manakin	Hvidbrystet Manakin
<i>Corapipo leucorrhoa</i>	White-bibbed Manakin	Hvidhaget Manakin
<i>Corapipo (l.) altera*</i>	White-ruffed Manakin	Kravemanakin
<i>Machaeropterus deliciosus</i>	Club-winged Manakin	Køllevinget Manakin
<i>Machaeropterus regulus</i>	Eastern Striped Manakin	Stribet Manakin
<i>Machaeropterus striolatus</i>	Western Striped Manakin	Vestlig Stribet Manakin
<i>Machaeropterus pyrocephalus</i>	Fiery-capped Manakin	Ildkronet Manakin
<i>Lepidothrix coronata</i>	Blue-crowned Manakin	Blåkronet Manakin
<i>Lepidothrix (c.) velutina*</i>	Velvety Manakin	Fløjsmanakin
<i>Lepidothrix (c.) exquisita*</i>	Exquisite Manakin	Perumanakin
<i>Lepidothrix isidorei</i>	Blue-rumped Manakin	Blågumpet Manakin
<i>Lepidothrix coeruleocapilla</i>	Cerulean-capped Manakin	Azurkronet Manakin
<i>Lepidothrix nattereri</i>	Snow-capped Manakin	Snehættemanakin
<i>Lepidothrix vilasboasi</i>	Golden-crowned Manakin	Gyldenkronet Manakin
<i>Lepidothrix iris</i>	Opal-crowned Manakin	Opalkronet Manakin
<i>Lepidothrix serena</i>	White-fronted Manakin	Hvidpandet Manakin
<i>Lepidothrix suavissima</i>	Orange-bellied Manakin	Tepuímanakin
<i>Manacus manacus</i>	White-bearded Manakin	Hvidskægget Manakin
<i>Manacus candei</i>	White-collared Manakin	Hvidkravet Manakin
<i>Manacus vitellinus</i>	Golden-collared Manakin	Gyldenskægget Manakin
<i>Manacus (v.) cerritus*</i>	Almirante Manakin	Almirante-manakin
<i>Manacus aurantiacus</i>	Orange-collared Manakin	Orangekravet Manakin
<i>Manacus (a.) viridiventris*</i>	Greenish-bellied Manakin	Grønbuget Manakin
<i>Antilophia bokermanni</i>	Araripe Manakin	Araripe-manakin
<i>Antilophia galeata</i>	Helmeted Manakin	Hjelmmananakin
<i>Chiroxiphia linearis</i>	Long-tailed Manakin	Langhalet Manakin
<i>Chiroxiphia lanceolata</i>	Lance-tailed Manakin	Lansehalemanakin
<i>Chiroxiphia pareola</i>	Blue-backed Manakin	Pragtmanakin
<i>Chiroxiphia boliviiana</i>	Yungas Manakin	Yungasmanakin
<i>Chiroxiphia caudata</i>	Blue Manakin	Svalehalemanakin
<i>Chloropipo holochlora</i>	Green Manakin	Grøn Manakin
<i>Chloropipo flavicapilla</i>	Yellow-headed Manakin	Gulhovedet Manakin
<i>Chloropipo unicolor</i>	Jet Manakin	Atlaskmanakin
<i>Chloropipo uniformis</i>	Olive Manakin	Olivenmanakin

Trådhalet Manakin

<i>Xenopipo atronitens</i>	Black Manakin	Sort Manakin
<i>Heterocercus aurantiivertex</i>	Orange-crested Manakin	Orangekronet Manakin
<i>Heterocercus flavivertex</i>	Yellow-crested Manakin	Gulkronet Manakin
<i>Heterocercus linteatus</i>	Flame-crested Manakin	Flammekronet Manakin
<i>Pipra pipra</i>	White-crowned Manakin	Hvidkronet Manakin
<i>Pipra (p.) anthracina*</i>	Zeledon's Manakin	Costa Rica-manakin
<i>Pipra aureola</i>	Crimson-hooded Manakin	Flammemanakin
<i>Pipra filicauda</i>	Wire-tailed Manakin	Trådhalet Manakin
<i>Pipra fasciicauda</i>	Band-tailed Manakin	Halebåndsmannakin
<i>Pipra cornuta</i>	Scarlet-horned Manakin	Hornmanakin
<i>Pipra mentalis</i>	Red-capped Manakin	Hættemanakin
<i>Pipra chloromeros</i>	Round-tailed Manakin	Rundhalet Manakin
<i>Pipra erythrocephala</i>	Golden-headed Manakin	Gyldenhovedet Manakin
<i>Pipra rubrocipilla</i>	Red-headed Manakin	Rødhovedet Manakin

PASSERIFORMES - Cotingidae**COTINGAS**

Cotingidae - Ifølge den nyeste DNA-forskning er flere fugleslægter i den følgende liste fejlplaceret her. Slægterne *Tityra*, *Schiffornis*, *Laniocera*, *Laniisoma*, *Iodopleura*, *Xenopsaris*, *Platyparus* og *Pachyramphus* bør placeres i en egen familie Tityridae, og *Oxyruncus* bør placeres Inserta Sedis (Molecular Phylogenetics and Evolution 42 (2007): 25-37).

		KOTINGAER
<i>Tityra inquisitor</i>	Black-crowned Tityra	Sortkronet Tityra
<i>Tityra cayana</i>	Black-tailed Tityra	Sorthalet Tityra
<i>Tityra semifasciata</i>	Masked Tityra	Masketityra
<i>Schiffornis major</i>	Varzea Schiffornis	Stor Drosselmanakin
<i>Schiffornis turdina</i>	Thrush-like Schiffornis	Drosselmanakin
<i>Schiffornis (t.) veraepacis*</i>	Brown Schiffornis	Brun Drosselmanakin
<i>Schiffornis virescens</i>	Greenish Mourner	Oliven Drosselmanakin
<i>Laniocera rufescens</i>	Speckled Mourner	Plettet Klagetyran
<i>Laniocera hypopyrra</i>	Cinereous Mourner	Askegrå Klagetyran
<i>Iodopleura pipra</i>	Buff-throated Purpletuft	Lille Purpurkvast
<i>Iodopleura fusca</i>	Dusky Purpletuft	Mørk Purpurkvast
<i>Iodopleura isabellae</i>	White-browed Purpletuft	Purpurkvast
<i>Laniisoma elegans</i>	Brazilian Laniisoma	Brasiliansk Laniisoma
<i>Laniisoma (e.) buckleyi*</i>	Andean Laniisoma	Andeslaniisoma
<i>Xenopsaris albinucha</i>	White-naped Xenopsaris	Hvidnakket Bekard
<i>Pachyramphus viridis</i>	Green-backed Becard	Grønrygget Bekard
<i>Pachyramphus xanthogenys</i>	Yellow-cheeked Becard	Gulkindet Bekard
<i>Pachyramphus versicolor</i>	Barred Becard	Vatret Bekard
<i>Pachyramphus spodiurus</i>	Slaty Becard	Skiferbekard
<i>Pachyramphus rufus</i>	Cinereous Becard	Askebekard
<i>Pachyramphus castaneus</i>	Chestnut-crowned Becard	Gråbåndet Bekard
<i>Pachyramphus cinnamomeus</i>	Cinnamon Becard	Kanelbekard
<i>Pachyramphus polychoterus</i>	White-winged Becard	Hvidvinget Bekard
<i>Pachyramphus marginatus</i>	Black-capped Becard	Sortkronet Bekard
<i>Pachyramphus albogriseus</i>	Black-and-white Becard	Broget Bekard
<i>Pachyramphus major</i>	Grey-collared Becard	Mexicobekard
<i>Pachyramphus surinamus</i>	Glossy-backed Becard	Surinambekard
<i>Platyparis aglaiae</i>	Rose-throated Becard	Rosastrubet Bekard
<i>Platyparis homochrous</i>	One-colored Becard	Sørgebekard
<i>Platyparis minor</i>	Pink-throated Becard	Rødstrubet Bekard
<i>Platyparis validus</i>	Crested Becard	Topbekard
<i>Platyparis niger</i>	Jamaican Becard	Jamaicabekard
<i>Phibalura flavirostris</i>	Swallow-tailed Cotinga	Svalehalekotinga
<i>Phibalura boliviiana</i>	Palkachupa Cotinga	Palkachupakotinga
<i>Ampelion rubrocristatus</i>	Red-crested Cotinga	Rødtoppet Kotinga
<i>Ampelion rufaxilla</i>	Chestnut-crested Cotinga	Kravekotinga

<i>Zaratornis stresemanni</i>	White-cheeked Cotinga	Hvidkindet Kotinga
<i>Doliornis remseni</i>	Chestnut-bellied Cotinga	Kastanjebuget Kotinga
<i>Doliornis sclateri</i>	Bay-vented Cotinga	Inkakotinga
<i>Phytotoma raimondii</i>	Peruvian Plantcutter	Perubladskærer
<i>Phytotoma rutila</i>	White-tipped Plantcutter	Rød Bladskærer
<i>Phytotoma rara</i>	Rufous-tailed Plantcutter	Chilebladskærer
<i>Carpornis cucullata</i>	Hooded Berryeater	Hættekotinga
<i>Carpornis melanocephala</i>	Black-headed Berryeater	Grønrygget Hættekotinga
<i>Pipreola riefferii</i>	Green-and-black Fruiteater	Grøn Frugtæder
<i>Pipreola (r.) tallmanorum*</i>	Black-headed Fruiteater	Sorthovedet Frugtæder
<i>Pipreola intermedia</i>	Band-tailed Fruiteater	Båndhalefrugtæder
<i>Pipreola arcuata</i>	Barred Fruiteater	Tværstribet Frugtæder
<i>Pipreola aureopectus</i>	Golden-breasted Fruiteater	Gulbrystet Frugtæder
<i>Pipreola jucunda</i>	Orange-breasted Fruiteater	Orangebrystet Frugtæder
<i>Pipreola lubomirskii</i>	Black-chested Fruiteater	Sortbrystet Frugtæder
<i>Pipreola pulchra</i>	Masked Fruiteater	Maskefrugtæder
<i>Pipreola frontalis</i>	Scarlet-breasted Fruiteater	Rødbrystet Frugtæder
<i>Pipreola (f.) squamipectus*</i>	Bluish-crowned Fruiteater	Skælbrystet Frugtæder
<i>Pipreola chlorolepidota</i>	Fiery-throated Fruiteater	Flammefrugtæder
<i>Pipreola formosa</i>	Handsome Fruiteater	Pragtfrugtæder
<i>Pipreola whitelyi</i>	Red-banded Fruiteater	Tepuífrugtæder
<i>Oxyruncus cristatus</i>	Sharpbill	Spidsnæb
<i>Ampeliooides tschudii</i>	Scaled Fruiteater	Hvidstrubet Frugtæder
<i>Rupicola rupicola</i>	Guianan Cock-of-the-rock	Orange Klippehane
<i>Rupicola peruvianus</i>	Andean Cock-of-the-rock	Rød Klippehane

<i>Phoenicircus carnifex</i>	Guianan Red Cotinga	Blodkotinga
<i>Phoenicircus nigricollis</i>	Black-necked Red Cotinga	Rød Kotinga
<i>Cotinga amabilis</i>	Lovely Cotinga	Pragtkotinga
<i>Cotinga ridgwayi</i>	Turquoise Cotinga	Turkiskotinga
<i>Cotinga nattererii</i>	Blue Cotinga	Blå Kotinga
<i>Cotinga maynana</i>	Plum-throated Cotinga	Blommestrubet Kotinga
<i>Cotinga cotinga</i>	Purple-breasted Cotinga	Purpurkotinga
<i>Cotinga maculata</i>	Banded Cotinga	Blå Purpurkotinga
<i>Cotinga cayana</i>	Spangled Cotinga	Pletkotinga
<i>Procnias tricarunculatus</i>	Three-wattled Bellbird	Trelappet Klokkefugl
<i>Procnias albida</i>	White Bellbird	Hvid Klokkefugl
<i>Procnias averano</i>	Bearded Bellbird	Skægklokkefugl
<i>Procnias nudicollis</i>	Bare-throated Bellbird	Nøgenstrubet Klokkefugl
<i>Tijuca atra</i>	Black-and-gold Cotinga	Gulvinget Kotinga
<i>Tijuca condita</i>	Grey-winged Cotinga	Gråvinget Kotinga

<i>Lipaugs weberi</i>	Chestnut-capped Piha	Kastanjekronet Piha
<i>Lipaugs fuscocinereus</i>	Dusky Piha	Askepiha
<i>Lipaugs uropygialis</i>	Scimitar-winged Piha	Seglvingepiha
<i>Lipaugs unirufus</i>	Rufous Piha	Rustpiha
<i>Lipaugs vociferans</i>	Screaming Piha	Larmpiha
<i>Lipaugs lanioides</i>	Cinnamon-vented Piha	Stor Larmpiha
<i>Lipaugs streptophorus</i>	Rose-collared Piha	Halsbåndspiha
<i>Conioptilon mcilhennyi</i>	Black-faced Cotinga	Sortmasket Kotinga
<i>Snowornis subalaris</i>	Grey-tailed Piha	Gråhalepiha
<i>Snowornis cryptolophus</i>	Olivaceous Piha	Olivenpiha
<i>Porphyrolaema porphyrolaema</i>	Purple-throated Cotinga	Purpurstrubet Kotinga
<i>Xipholena punicea</i>	Pompadour Cotinga	Pompadurkotinga
<i>Xipholena lamellipennis</i>	White-tailed Cotinga	Hvidhalekotinga
<i>Xipholena atropurpurea</i>	White-winged Cotinga	Hvidvingekotinga
<i>Carpodectes hopkei</i>	Black-tipped Cotinga	Sortplettet Snekotinga
<i>Carpodectes nitidus</i>	Snowy Cotinga	Snekotinga
<i>Carpodectes antoniae</i>	Yellow-billed Cotinga	Gulnæbbet Snekotinga
<i>Gymnoderus foetidus</i>	Bare-necked Fruitcrow	Nøgenhalset Frugtkrage
<i>Querula purpurata</i>	Purple-throated Fruitcrow	Purpurstrubet Frugtkrage
<i>HaematoDERUS militaris</i>	Crimson Fruitcrow	Karminfugtkrage
<i>Pyroderus scutatus</i>	Red-ruffed Fruitcrow	Fregatfugtkrage
<i>Perissocephalus tricolor</i>	Capuchinbird	Kapucinerfugl
<i>Cephalopterus glabricollis</i>	Bare-necked Umbrellabird	Fregatparasolfugl
<i>Cephalopterus ornatus</i>	Amazonian Umbrellabird	Pragtparasolfugl
<i>Cephalopterus penduliger</i>	Long-wattled Umbrellabird	Hjelmparasolfugl

PASSERIFORMES - *Incertae Sedis* UKLAR PLACERING

Incera Sedis - Også de følgende slægter falder udenfor de anerkendte familier, og kan derfor indtil videre placeres i denne kategori: *Oxyruncus*, *Onychorhynchus*, *Myiobius* og *Terenotriccus*.

<i>Piprites griseiceps</i>	Grey-headed Piprites	Gråhovedet Manakin
<i>Piprites chloris</i>	Wing-barred Piprites	Grånakket Manakin
<i>Piprites pileata</i>	Black-capped Piprites	Sortkronet Manakin

PASSERIFORMES - Furnariidae**OVENBIRDS****OVNFUGLE**

Furnariidae - Ifølge den nyeste DNA-systematik omfatter familien tre udviklingslinjer (Molecular Phylogenetics and Evolution 30 (2002): 499-512 og 32 (2004): 11-24): den dybeste gren på stamtræet (ny underfamilie Sclerurinae; med *Sclerurus*, *Geositta* og *Geobates*), dernæst Furnariinae (egentlige ovnfugle) og Dendrocolaptinae (trækrybere). Indenfor Furnariinae er der behov for mange ændringer både i rækkefølge og opdeling i slægter; f.eks. er *Asthenes* og *Upucerthia* polyfyletiske grupper (som bør opdeles i flere slægter).

OSCINES

Sangfuglene omfatter nogle gamle australske grupper (Menuridae t.o.m. Cinclosomatidae) som gav opbakning til de kragelignende fugle (Platysteiridae t.o.m. Paradisaeidae) og Passerida, som omfatter alle de øvrige godt 3500 arter af spurvefugle (sammenfattet i Zoologica Scripta 35 (2006): 149-186). Den nyeste DNA-forskning lægger op til betydelige ændringer i systematikken indenfor næsten alle disse grupper.

PASSERIFORMES - Platysteiridae**WATTLE-EYES, BATISES**

Rækkefølgen af de følgende familier af kragelignende fugle burde byttes om, idet den afrikanske radiation (udvikling af arterne) med Platysteiridae og Malaconotidae er forholdsvis ung og derfor burde placeres efter Paradisaeidae.
Platysteiridae - Slægterne Megabyas og Bias danner (sammen med Philentoma, nu Incertae Sedis) en udviklingslinje sammen med Vangidae (vangaer) og burde derfor flyttes.

Picathartidae og **Chaetopidae** betragtes som de ældste udviklingslinjer indenfor det store sangfuglekompleks Passeridae, som for ca. 45 millioner år siden spredte sig fra Australien og koloniserede de øvrige kontinenter. Nye DNA-data har afsløret nogle andre små, relikte grupper fra denne dramatiske fase i sangfuglenes „verdenserobring“: Hyliotidae (ny familie med *Hyliota*), Stenostiridae (ny familie: *Stenostira*, *Elminia*, *Culicicapa*, og muligvis *Chelidorhynx*). Også Regulidae (fuglekonger), Bombycillidae (silkehaler) og en gruppe omfattende Paridae (mejsjer) og Remizidae (pungmejsjer) repræsenterer gamle udviklingslinjer blandt sangfuglene. De øvrige sangfugle falder dog indenfor fire store udviklingslinjer: Musciapoidea (med stære, drosler, fluesnappere o.l.), Certhioidea (med træløbere, spætmeyser, gærdesmutter o.l.), Sylvoidea (lærker, svale og diverse sangerlignende grupper) og Passeroidea (spurve- og finkelignende fugle) (se oversigt i Zoologica Scripta 35 (2006): 149-186).

PASSERIFORMES - Picathartidae**BALD CROWS**

Picathartidae - Denne familie bør også omfatte *Eupetes macrocerus* (nu i Eupetidae).

<i>Picathartes gymnocephalus</i>	White-necked Picathartes	Gulhovedet Kragedrossel
<i>Picathartes oreas</i>	Grey-necked Picathartes	Rødhovedet Kragedrossel

<i>Heteralocha acutirostris*</i> †	Huia	Huia
<i>Chaetops frenatus</i>	Cape Rockjumper	Rødbrun Klippehopper
<i>Chaetops aurantius</i>	Drakensburg Rockjumper	Orange Klippehopper

PASSERIFORMES - Bombycillidae**WAXWINGS & ALLIES**

Bombycillidae - Det er uklart om denne gamle udviklingslinje burde splittes op i flere familier.

<i>Bombycilla garrulus</i>	Bohemian Waxwing	Silkehale
<i>Bombycilla japonica</i>	Japanese Waxwing	Japansk Silkehale
<i>Bombycilla cedrorum</i>	Cedar Waxwing	Cedersilkehale
<i>Phainoptila melanoxantha</i>	Black-and-yellow Phainoptila	Gulgumpet Silkemonark
<i>Ptilogonyx cinereus</i>	Grey Silky-flycatcher	Grå Silkemonark

<i>Ptilogonys caudatus</i>	Long-tailed Silky-flycatcher	Langhalet Silkemonark
<i>Phainopepla nitens</i>	Phainopepla	Sort Silkemonark
<i>Hypocolius ampelinus</i>	Hypocolius	Hypocolius

PASSERIFORMES - Dulidae**PALMCHAT***Dulus dominicus* Palm Chat**PALMEDROSSEL****Palmedrossel****PASSERIFORMES - Paridae****TITS, CHICKADEES****MEJSER**

Paridae - De fleste mejser har traditionelt været placeret i en stor slægt, *Parus*. Ifølge den nyeste DNA-systematik er det fornuftigt at dele den op i flere distinkte udviklingslinjer med egne slægtsnavne (se Auk 122 (2005): 121-143).

Den store gruppe af finnæbbede sangfugle som traditionelt har været kaldt „sangere“ har vist sig at omfatte mange uafhængige udviklingslinjer, og de bør derfor deles op i flere familier. Indenfor sangerkomplekset (Sylvoidea) placeres først to tidlige udviklingslinjer *Nicator* (nicatorer) og *Sphenoeacus*-gruppen (*Sylvietta*, *Achaetops*, *Sphenoeacus*, *Melocichla*, „*Bradypterus*“ *victorini*, *Macrosphenus*) (se oversigt i *Zoologica Scripta* 35 (2006): 149-186). Der foreligger ikke en endelig familieopdeling af de øvrige sangere.

CISTICOLAS & ALLIES

CISTUSSANGERE

Cisticolidae - Ifølge den nyeste DNA-systematik bør denne gruppe af sangere også omfatte slægterne *Neomixis*, *Orthotomus* (undtagen *O. cucullatus*), *Artisornis* og *Poliolais* (nedenfor placeret Incertae Sedis) og *Bathmocercus* (nu i *Sylviidae*).

PASSERIFORMES - *Pycnonotidae***BULBLS****BULBUL'ER**

Pycnonotidae - Den nyeste DNA-forskning viser at de asiatiske arter (inkl. alle *Pycnonotus*) og de afrikanske er to adskilte udviklingslinjer, og den følgende rækkefølge er derfor ikke naturlig. Opdelingen i slægter laves om og der kommer flere nye slægtsnavne (Zoologica Scripta 36 (2007): 417-427).

PASSERIFORMES - Timaliidae**BABBLERS, PARROTBUCKS****TIMALIER & PAPEGØJENÆB**

Timaliidae - En omfattende revision er nødvendig; bl.a. er det veldokumenteret at *Sylvia* og *Parisoma* er timaler, nært beslægtet med *Pseudoalcippe*, *Lioptilus* og *Fulvetta* (tidligere *Alcippe*). *Pteruthius* er beslægtet med Vireonidae (vireoer). *Zosteropidae* (brillefugle) bør inkluderes i Timaliidae, nær *Yuhina*.

PASSERIFORMES - Rhabdornithidae**PHILIPPINE CREEPERS****KRYBERE**

Rhabdornithidae - *Rhabdornis* repræsenterer den ældste udviklingslinje indenfor stære og bør derfor placeres først indenfor Sturnidae.

<i>Rhabdornis mystacalis</i>	Stripe-headed Creeper	Hvidbrystet Kryber
<i>Rhabdornis inornatus</i>	Stripe-breasted Creeper	Brunakket Kryber
<i>Rhabdornis grandis</i>	Long-billed Creeper	Luzonkryber

PASSERIFORMES - Sturnidae**STARLINGS****STÆRE**

Sturnidae - Ifølge ny komplet analyse med DNA-data (Molecular Phylogenetics and Evolution 41 (2006): 333-344 og 42 (2007) i trykket) er der lagt op til betydelige ændringer i stærernes klassifikation. Hovedgrupperne er: *Rhabdornis*; Indo-Pacifiske stære (*Aplonis* og „beostære“); Eurasiatiske stære (*Acridotheres*, *Leucopsar*, *Sturnus* og *Creatophora*) og de afrikanske glansstære. Der er behov for betydelige ændringer af slægtsnavne, især indenfor *Lamprotornis*, som nu er en polyfyletisk (af forskellig oprindelse) gruppe. *Buphagus*-arterne er ikke stære.

<i>Aplonis metallica</i>	Metallic Starling	Pragttræstær

PASSERIFORMES - Turdidae**THRUSHES**

Turdidae - Den følgende rækkefølge af slægter og artsgrupper følger ikke slægteskabsforholdene i gruppen (se f.eks. Mol. Phyl. Evol. 32 (2004): 264-273 og 34 (2005): 486-500). Solitærer (*Myadestes*, *Neocossyphus*) og *Sialia* repræsenterer to uafhængige dybe udviklingslinjer og bør komme først. De nyeste DNA-data viser at flere slægter (*Pseudocossyphus*, *Brachypteryx*, *Alethe* og *Pseudalethe*) bør flyttes til Muscicapidae. Den store slægt *Zoothera* er

polyfyletisk og de afrikanske og flere indoaustralske arter (*citrina*, *schistacea*, *dumasi*, *oiceyi*, *interpres*, *leucolaema*, *erythronota*, *mendeni*, *dohertyi*, *wardii*, *cinerea* og *peroni*) burde derfor placeres i en egen slægt *Geocichla*.

PASSERIFORMES - Muscicapidae
CHATS, OLD WORLD FLYCATCHERS

JORDSANGERE & FLUESNAPPERE

Muscicapidae - De nyeste DNA-data viser at gruppens tidlige radiation (udvikling af arterne) foregik i Asien, og at de afrikanske smådrosler („jordsangere“) udgør en nyere, monofyletisk undergruppe. Der er behov for at ændre rækkefølgen af slægterne og tilføre flere slægter fra Turdidae (Pseudocossyphus, Brachypteryx, Alethe og Pseudalethe). Myioparus scita er fejlagtigt placeret her, idet den repræsenterer den nyoprettede familie Stenostiridae (under navnet Stenostira scita).

PASSERIFORMES - Nectariniidae**SUNBIRDS**

Nectarinidae - Opdelingen i slægter er ustabil, så endelig navngivning må afvente afslutningen af en omfattende DNA-baseret phylogeni (udredning). *Arachnothera* og *Hypogramma* er de ældste udviklingslinjer og bør derfor stå først.

PASSERIFORMES - Coerebidae**BANANAQUIT****BANANSMUTTE**

Coerebidae - Banansmutten er nærmest beslægtet med græsfinker (*Loxigilla*, *Tiaris*) i Thraupidae.

<i>Coereba flaveola</i>	Bananaquit	Banansmutte
<i>Coereba (f.) bahamensis*</i>	Bahama Bananaquit	Bahamabanansmutte

PASSERIFORMES - Emberizidae**BUNTINGS, NEW WORLD SPARROWS & ALLIE****VÆRLINGER**

Emberizidae - Den nyste DNA-forskning har ført til en dramatisk revision af slægtskabet mellem værlinge, tangarer og kardinaler (resume i Zoologica Scripta 35 (2006): 149-186). Mange slægter er allerede blevet flyttet mellem grupperne og flere ændringer vil følge (f.eks. bør *Paroaria* overføres til Thraupidae). Slægterne *Calcarius* og *Plectrophenax* udgør den tidligst udspalte uudviklingslinje og burde derfor placeres allerførst, foran de asiatiske værlinge.

<i>Melophus lathami</i>	Crested Bunting	Topværling
<i>Latoucheornis siemsseni</i>	Slaty Bunting	Blåværling
<i>Emberiza calandra</i>	Corn Bunting	Bomlærke
<i>Emberiza citrinella</i>	Yellowhammer	Gulspurv
<i>Emberiza leucocephalos</i>	Pine Bunting	Hvidkindet Værling
<i>Emberiza cia</i>	Rock Bunting	Klippeværling
<i>Emberiza godlewskii</i>	Godlewski's Bunting	Bjergværling
<i>Emberiza cioides</i>	Meadow Bunting	Engværling

PASSERIFORMES - Thraupidae**TANAGERS & ALLIES**

Thraupidae - Den nyste DNA-forskning har ført til en dramatisk revision af slægtskabet mellem værlinger, tangarer og kardinaler (se Zoologica Scripta 35 (2006): 149-186). Mange slægter er allerede blevet flyttet mellem grupperne og flere ændringer vil følge (f.eks. bør *Chlorospingus* og nogle små slægter overføres til Emberizidae og *Piranga* og *Habia* til Cardinalidae).
